NURTUREPATH AI / SAFEHER

# Project Overview & Brand Guide

Problem, solution, user journeys, differentiation, visual identity, sustainability and application readiness.

Version 1.0 | 12 October 2026 | Ghana-first | UNFPA SafeTech Africa HackLab 2026

## Executive summary

NurturePath AI — SafeHer is a Ghana-first, privacy-conscious information and support-navigation platform for adolescent girls and young women. It combines accessible, age-appropriate sexual and reproductive health and rights education, digital safety guidance, child marriage prevention information and a verified support directory. Its purpose is to reduce information barriers, not replace professionals.

Proposed challenge alignment: SafeTech Africa HackLab 2026, Safe Informational Spaces. This is a proposed submission concept; eligibility, evaluation and acceptance depend on the official application rules.

## The problem

Adolescent girls and young women may face stigma, misinformation, language barriers, costly connectivity, online harassment, coercion and difficulty locating reliable support. Generic web search can return unreliable or irrelevant advice. A digital tool that merely chats without safe, verified next steps can leave users stranded.

The solution must balance access with safety: educational content can be available without accounts, while personal disclosures and referrals require strict safeguards.

## Target beneficiaries and stakeholders

Primary: adolescent girls and young women, especially in low-resource settings. Secondary: youth educators, community organizations, safeguarding teams and verified service providers. Initial geography: Ghana; expansion requires locally reviewed content, laws, languages and verified support networks.

## Product pillars

Ask SafeHer: source-grounded educational AI, with clear uncertainty and no diagnosis. Know Your Rights: reviewed bite-size lessons and quizzes. Digital Safety Centre: privacy, cyberbullying, harassment and coercion guidance. Find Support: verified directory and safe manual referral instructions. Admin: approval workflow, verification and anonymous aggregate metrics.

Optional accounts are not required for basic education. No automated sensitive referral submissions in the initial MVP.

## Illustrative user journeys

Journey A: A user asks about unwanted online messages, receives reviewed safety education, sees source links, and navigates to appropriate support resources. Journey B: A user reads a consent lesson offline and completes an optional quiz. Journey C: A user filters support organizations by region and service type and sees verification dates.

All early demo users and service entries are synthetic. Do not claim live referrals or real-world impact until independently evidenced.

## Why this concept differs

The proposed advantage is the combination of reviewed youth-friendly information, privacy-first low-data access, and actionable service discovery with explicit verification status. Differentiation is a hypothesis requiring competitor review and user validation, not a proven uniqueness claim.

## Brand identity

Name: NurturePath AI — SafeHer. Tagline: Safe information. Safe choices. Safer futures. Brand voice: reassuring, non-judgmental, precise, empowering and never sensational.

Palette: Deep Navy #123047 (trust); Teal #087E83 (navigation); Soft Mint #E9F7F4 (calm surfaces); Warm Coral #F4A58A (selective warmth); White #FFFFFF; Slate #475569. Typography: Inter. Logo: original abstract heart/path/shield SVG. Avoid stereotyped images of victims and inappropriate medical insignia.

## Interface principles

Mobile-first, responsive for 320px to desktop, WCAG 2.2 AA target, strong contrast, readable labels, 44px touch targets, quick exit with honest limitations, multilingual-ready architecture and low-bandwidth public resources. Use inclusive language, no coercive account creation and visible sources/review dates.

## Technology and open source

Proposed stack: Next.js, TypeScript, Tailwind, PostgreSQL, Prisma, reviewed-source retrieval, optional AI provider, PWA public-content caching and role-based admin. Publish code under a compatible open-source license while protecting credentials, sensitive information and third-party proprietary assets.

Open-source licensing of software does not require publishing sensitive user data or private operational records.

## Safety, ethics and boundaries

No diagnosis, no automated emergency intervention, no unverified crisis contact details, no disclosure of sensitive information to unapproved third parties, no model training on chats without valid authorization. For minors, obtain specialist safeguarding and legal review before any sensitive data collection or real-world referrals.

Implement accurate privacy notices, minimization, retention limits, authorization, encryption, human review, and a tested incident response process.

## Business and sustainability

Possible sustainability: funded deployments through NGOs, foundations and public health/youth programs; institutional service-directory administration and training; philanthropic support for free youth access. Do not monetize sensitive disclosures or sell user data. Revenue model is exploratory and needs stakeholder validation.

## 12-month proposed roadmap

Months 1–2: MVP, content review and adult usability testing. Months 3–4: verify Ghana directory partners and undertake legal/safeguarding review. Months 5–6: pilot public information service and collect privacy-safe usability measures. Months 7–9: improve languages and accessibility, evaluate user understanding. Months 10–12: publish evidence, refine sustainability, assess expansion readiness.

Each milestone requires owner, measurable deliverable, safety gate and budget allocation.

## Metrics and evidence

Measure reviewed content coverage, successful source-grounded answer rate, task completion, accessibility performance, verified directory coverage, satisfaction and aggregate engagement. Report pilot sample sizes and limitations. Do not invent adoption, clinical outcomes, referrals or partnerships.

## HackLab submission checklist

Confirm applicant age and eligibility from the official form; verify challenge category and deadline. Prepare problem statement, innovation narrative, demo link, GitHub repository, 12-month roadmap, safety and inclusion note, team biographies, implementation budget, honest stage description and evidence of testing.

Proposed demo: open home on a small phone, browse a consent lesson, ask a safe educational question with citations, search a verified service directory, activate Quick Exit, demonstrate offline public content and admin content approval.

## Risk register

Risks: AI misinformation, exposure of sensitive information, inaccurate directory contacts, unintended disclosure on shared devices, minors' safeguarding, connectivity failures, unreviewed translations and false emergency expectations. Mitigations: source-grounding, no chat retention by default, verification dates, Quick Exit caveats, legal/safeguarding review, offline public content only and clear service limitations.
